@Risk Software Installation Instructions

1. If you are accessing the NUS network remotely, run and log in to **NUS VPN** on your computer.

   If you have not used NUS VPN before, go to https://nusit.nus.edu.sg/eguides/ for instructions on nVPN installation.

2. Download the installation files (ie2111-software.zip) from https://canvas.nus.edu.sg/courses/71421/files/folder/software

   UNZIP and extract all the three files to the same folder:
   1. addhost.bat
   2. RiskPlatform-cust-Setup.exe
   3. Palisade_NetworkClient.ini

   Note that you must fully extract all the 3 files out of the ZIP file to another folder in order to run the following properly. Use the lecture notes password if prompted. Running the above directly from an open Windows File Explorer window will not work.

3. Right-click on "addhost.bat" and select "**Run as administrator**"
   If this does not work, you may (1) run as administrator any command prompt or terminal, (2) change the current directory to the one in step 2, and (3) run addhost.bat from the terminal prompt. *If you have no clue what the above steps mean or have never used terminal or command line mode before, consult the course tutors.*

4. Double-click on "RiskPlatform-cust-Setup.exe" to start the installation and follow the instructions.

5. After installation is completed, check that you have access to a valid license:

   Run @Risk shortcut created on the desktop.

   Select the @Risk tab on the left of the @Risk ribbon.

   Select "License manager" and check that you have a valid network license.

   Use "select license" to change if you have other licenses installed previously.
